

# Payroll Timesheets

Last Modified on 01/11/2023 11:21 am EST

Payroll Timesheets are typically used if your company is creating an export file for your entire company payroll to send to ADP or Paycomm payroll processing companies. Your company may use the Payroll Timesheets method without using the export functionality.

The Labor costs that are applied to Jobs when using Payroll Timesheets is determined by the rates set up for each employee in the Employee setup table within SedonaSetup. The labor rate entered in the Employee setup is the actual labor rate the Installer is paid since this timesheet information is used to generate payroll checks.

Once a Payroll Timesheet Batch is saved, the hours/dollars will appear within the Job.

□

Below are the Timesheets that were posted to the Job as a result of saving the Payroll Timesheet Batch.
