

Endpoints to call new site/system link/unlink stored procedures

Last Modified on 09/06/2023 2:59 pm EDT

To accommodate integration functionality changes, new stored procedures were added in SedonaOffice to perform the linking and unlinking of sites and systems. We added new endpoints to call these stored procedures:

- POST /api/CustomerSite/CSIntegration/Link
- POST /api/CustomerSite/CSIntegration/Unlink
- POST /api/CustomerSystem/CSIntegration/Link
- POST /api/CustomerSystem/CSIntegration/Unlink

These endpoints will return 501 "not implemented" if the corresponding SedonaOffice stored procedure is not found.

We modified these endpoints to include a new Integration Id parameter:

- PUT /api/CustomerSystem/AutoSystem
- PUT /api/CustomerSystem/AutoSystemEditBySystemId

If the corresponding SedonaOffice stored procedure has not been updated to accept the Integration Id parameter, it will be re-called without that parameter.
